

## Upper and Lower Prices

Define the range of price at which the optimization routine will not alter the amounts of the single ingredient (all other factors and amounts being the same). Choice white grease is included in the ration at the rate of 2lbs. The price is \$125 a CWT. Lower price is \$90 and upper Price is \$150. If the price alters to \$110 the amount does not change being optimized in the ration if nothing else is changed. If the Price drops out of that range say \$80, the ration will recalculate the amount of grease in the ration and a new upper and lower price will be calculated.
